

DEFORMATIONS OF SEMISIMPLE POISSON PENCILS OF HYDRODYNAMIC TYPE ARE UNOBSTRUCTED

GUIDO CARLET, HESSEL POSTHUMA, AND SERGEY SHADRIN

ABSTRACT. We prove that the bihamiltonian cohomology of a semisimple pencil of Poisson brackets of hydrodynamic type vanishes for almost all degrees. This implies the existence of a full dispersive deformation of a semisimple bihamiltonian structure of hydrodynamic type starting from any infinitesimal deformation.

1. INTRODUCTION

1.1. Basic setup from the theory of integrable hierarchies. Consider a system of evolutionary PDEs with one spatial variable x and n dependent variables of the form

$$\frac{\partial u^i}{\partial t} = A_j^i(u)u_x^j + \epsilon \left(B_j^i(u)u_{xx}^j + C_{jk}^i u_x^j u_x^k \right) + O(\epsilon^2).$$

(Here, and in the following we use the summation convention.) The right hand side of this equation is represented as a formal power series in ϵ , where

the coefficient of ϵ^k is a homogeneous differential polynomial, i.e. an homogeneous polynomial in $u^{i,d} := \partial_x^d u^i$, $i = 1, \dots, n$, $d = 1, \dots, k$, $\deg u^{i,d} = d$, of degree $k+1$ whose coefficients are smooth functions of coordinates u^1, \dots, u^n on some domain $U \subset \mathbb{R}^n$. We can think of the $u^i(x)$ as (ϵ -power series of) smooth functions of $x \in S^1$ or Schwarzian functions of $x \in \mathbb{R}$.

On of the possible ways to define and study an integrable hierarchy of partial differential equations of this type uses so-called bihamiltonian structures with hydrodynamic limit.

A bihamiltonian structure with hydrodynamic limit is given by: a pencil of two compatible Poisson structures on the space of local functionals of the form

$$\{u^i(x), u^j(y)\}_a = \left(g_a^{ij}(u) \partial_x + \Gamma_{k,a}^{ij}(u) u_x^k \right) \delta(x-y) + O(\epsilon), \quad a = 1, 2$$

where the leading order is given by two Poisson brackets of hydrodynamic type, and the terms of higher order in ϵ are homogeneous differential operators acting on $\delta(x-y)$, and their coefficients are homogeneous differential polynomials in the dependent variables u^1, \dots, u^n ; a system of Hamiltonians of the form

$$H_a[u] = \int dx \cdot (h_a(u) + O(\epsilon)), \quad a = 1, 2$$

with higher order terms in ϵ given by homogeneous differential polynomials in u^1, \dots, u^n .

The evolutionary PDE above can be written as an Hamiltonian flow w.r.t. both Poisson structures

$$\frac{\partial u^i}{\partial t} = \{u^i(x), H_a\}_a$$

for $a = 1, 2$.

The natural equivalence relation on these systems, and in particular on the pencils of Poisson structures with hydrodynamic limit, is given by the so-called Miura transformations, which are transformations of the dependent variables of the form

$$u^i \mapsto v^i(u) + O(\epsilon), \quad (1)$$

where higher order terms in ϵ are homogeneous differential polynomials in u^1, \dots, u^n , and the leading term is a diffeomorphism.

In this context, an important problem is to classify the pencils of Poisson structures with hydrodynamic limit, up to the equivalence given by Miura transformations. In the scalar ($n = 1$) case a complete solution of this classification problem has been obtained, see [13, 10, 1, 12, 4, 5].

In the general $n > 0$ case (see [3, 6, 7, 9, 11]) it is convenient to make the assumption that the pencil of Poisson brackets of hydrodynamic type that we are considering is semisimple. A Poisson pencil of hydrodynamic type

$$\left(g_a^{ij}(u) \partial_x + \Gamma_{k,a}^{ij}(u) u_x^k \right) \delta(x-y), \quad a = 1, 2$$

is semisimple if the polynomial $\det \left(g_1^{ij} - \lambda g_2^{ij} \right)$ of degree n in λ has n pairwise distinct non-constant roots on $U \subset \mathbb{R}^n$. In such case [6] one can use the roots as a set of coordinates on U , called canonical coordinates. This choice

ensures that both metrics $g_{1,2}^{ij}$ are diagonal with diagonal entries respectively equal to $f^i(u)$, $u^i f^i(u)$, $i = 1, \dots, n$ for non-vanishing functions $f^i(u)$ on U .

In this paper we shall consider the deformation problem of semisimple Poisson pencils of hydrodynamic type by working in canonical coordinates. The change of coordinates to canonical ones is an example of a Miura transformation of the first kind, i.e., a diffeomorphism with the terms $O(\epsilon)$ in (1) equal to zero. By fixing these coordinates, we are therefore left with the problem of classifying Poisson Pencils up to Miura transformations of the second kind, that is, transformations of the dependent coordinates as in (1), with the zeroth order constant in ϵ equal to the identity. Since Miura transformations of the first and second kind obviously generate the whole Miura group, this classification problem is equivalent to the original one described above. Let us now give a precise formulation of this deformation problem in canonical coordinates.

1.2. Classification of Poisson pencils and the extension problem.

Let $\{\cdot, \cdot\}_\lambda^0 = \{\cdot, \cdot\}_2^0 - \lambda\{\cdot, \cdot\}_1^0$ be a semisimple Poisson pencil of hydrodynamic type [6], and let u^1, \dots, u^n be the associated canonical coordinates over a domain $U \subset \mathbb{R}^n$ where $u^i - u^j \neq 0$ for $i \neq j$. The two compatible Poisson brackets $\{\cdot, \cdot\}_{1,2}^0$ are of the form

$$\{u^i(x), u^j(y)\}_a^0 = g_a^{ij}(u(x))\delta'(x-y) + \Gamma_{k,a}^{ij}(u(x))u_x^k(x)\delta(x-y),$$

with $a = 1, 2$, $i, j = 1, \dots, n$, where the contravariant metrics are given by

$$g_1^{ij} = f^i \delta_{ij}, \quad g_2^{ij} = u^i f^i \delta_{ij} \quad (\text{no summation over } i)$$

and $\Gamma_{k,a}^{ij} = -g_a^{il} \Gamma_{lk,a}^j$, where $\Gamma_{lk,a}^j$ are the Christoffel symbols of the metric g_a^{ij} , and $f^1(u), \dots, f^n(u)$ are non-vanishing functions on U .

A deformation of $\{\cdot, \cdot\}_\lambda^0$ is given by a pencil

$$\{\cdot, \cdot\}_\lambda = \{\cdot, \cdot\}_2 - \lambda\{\cdot, \cdot\}_1$$

where $\{\cdot, \cdot\}_a$, $a = 1, 2$ are compatible Poisson brackets of the form

$$\{u^i(x), u^j(y)\}_a = \{u^i(x), u^j(y)\}_a^0 + \sum_{k>0} \epsilon^k \sum_{l=0}^{k+1} A_{k,l;a}^{ij}(u(x))\delta^{(l)}(x-y) \quad (2)$$

with $A_{k,l;a}^{ij} \in \mathcal{A}$ and $\deg A_{k,l;a}^{ij} = k - l + 1$. Here \mathcal{A} denotes the space of differential polynomials in u^1, \dots, u^n , i.e. formal power series in the variables $u^{i,s}$, $i = 1, \dots, n$, $s > 0$, with coefficients that are smooth functions of u^1, \dots, u^n . The degree is defined by setting $\deg u^{i,s} = s$.

Two deformations are equivalent if they are related by a Miura transformation (of the second kind [11]), i.e. by a change of variables of the form

$$u^i \mapsto \tilde{u}^i = u^i + \sum_{k>0} \epsilon^k F_k^i, \quad i = 1, \dots, n$$

with $F_k^i \in \mathcal{A}$ and $\deg F_k^i = k$.

An infinitesimal deformation $\{\cdot, \cdot\}_\lambda^{\leq 2}$ of $\{\cdot, \cdot\}_\lambda^0$ is given by a pair of compatible Poisson brackets of the form (2) where terms of $O(\epsilon^3)$ are disregarded. This means that in the expansion (2) above, we only consider the coefficients $A_{k,l;a}^{ij}(u(x))$ for k up to 2, so that the highest derivative $\delta^{(l)}(x-y)$ appearing

is 3. Two infinitesimal deformations are equivalent iff they are related by a Miura transformation up to $O(\epsilon^3)$. The following theorem, which classifies the deformations of $\{\cdot, \cdot\}_\lambda^0$, was proved in [9, 6].

Theorem 1. *Two deformations of $\{\cdot, \cdot\}_\lambda^0$ are equivalent if and only if the corresponding infinitesimal deformations are equivalent. Given an infinitesimal deformation of $\{\cdot, \cdot\}_\lambda^0$, the functions, called central invariants, defined by*

$$c_i(u) := \frac{1}{3(f^i(u))^2} \left(A_{2,3;2}^{ii} - u^i A_{2,3;1}^{ii} + \sum_{k \neq i} \frac{(A_{1,2;2}^{ki} - u^i A_{1,2;1}^{ki})^2}{f^k(u)(u^k - u^i)} \right),$$

for $i = 1, \dots, n$, only depend on the single variable u^i are invariant under Miura transformations. Two infinitesimal deformations of $\{\cdot, \cdot\}_\lambda^0$ are equivalent if and only if they have the same central invariants.

The main problem in the deformation theory of a semisimple Poisson pencil $\{\cdot, \cdot\}_\lambda^0$ is the problem of extension [12]. Making a choice of central invariants $c_1(u^1), \dots, c_n(u^n)$ fixes an equivalence class of infinitesimal deformations of $\{\cdot, \cdot\}_\lambda^0$, but the question is whether there exists a full deformation $\{\cdot, \cdot\}_\lambda$ that extends an infinitesimal one to all orders in ϵ . The main result of this paper is the affirmative answer to this question.

Theorem 2. *Let $\{\cdot, \cdot\}_\lambda^{\leq 2}$ be an infinitesimal deformation of a semisimple Poisson pencil of hydrodynamic type $\{\cdot, \cdot\}_\lambda^0$. Then there exists a deformation $\{\cdot, \cdot\}_\lambda$ that extends $\{\cdot, \cdot\}_\lambda^{\leq 2}$ to all orders in ϵ .*

1.3. Methods of proof and organization of the paper. The problem of the description of automorphisms, infinitesimal deformations, and obstructions to the extension of infinitesimal deformations for any algebraic structure can be formulated in terms of some cohomology groups associated to it. In our case, in order to prove that the deformation of a semisimple pencil of Poisson brackets is not obstructed we have to show that certain cohomology groups, called bihamiltonian cohomology, are equal to zero.

There is no straightforward way to compute these cohomology groups. However, Liu and Zhang have shown that the vanishing of these cohomology groups follows from the vanishing of the cohomology of the auxiliary complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$, defined below, in certain degrees. It is a difficult task to compute the full cohomology of this complex, however we are able to show vanishing of such cohomology in the required degrees using a clever choice of filtrations and the structure of the associated spectral sequences.

The paper is organized as follows. In Section 2 we recall the definition of the auxiliary complex and explain its relation to the problems of deformation of pencils of Poisson structures. In particular, we formulate a statement about the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ that implies Theorem 2. In Section 3 we introduce a series of filtrations on the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ that allows us to prove the key statement about its cohomology.

1.4. Conventions. Throughout the paper we use the summation convention in the sense that repeated (upper- and lower-)indices should be summed over. However, there are a few exceptions when the metrics $g_1^{ij} = f^i \delta_{ij}$ and

$g_2^{ij} = u^i f^i \delta_{ij}$, or the tensors derived from them are involved. Such equations always involve the functions f^i . To determine which indices are to be summed over, it suffices to consider the other side of the equation and the indices that appear in there.

2. THETA FORMALISM, POLYVECTOR FIELDS AND COHOMOLOGY

The deformation theory of a pencil of Poisson brackets is controlled by the so-called bihamiltonian cohomology defined on the space of local polyvector fields. In order to show the vanishing of such bihamiltonian cohomology in certain degrees, from which Theorem 2 follows, we consider the cohomology of a related complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$, introduced by Liu and Zhang [12]. This approach has a double advantage: first, we can work in the space $\hat{\mathcal{A}}$, where the identifications imposed by integration are not imposed, making computations simpler; second, we can compute the cohomology on the space $\hat{\mathcal{A}}[\lambda]$ of polynomials in λ , rather than the bihamiltonian cohomology on $\hat{\mathcal{A}}$, and this allows us to use directly the methods of spectral sequences associated with filtrations.

In this Section we review some basic definitions, mainly from [12], state our main theorem and derive its most important consequences.

2.1. Basic definitions. Consider the supercommutative associative algebra $\hat{\mathcal{A}}$ defined as

$$\hat{\mathcal{A}} = C^\infty(U)[[u^{i,1}, u^{i,2}, \dots; \theta_i^0, \theta_i^1, \theta_i^2, \dots]],$$

where $u^{i,s}$, $i = 1, \dots, n$, $s = 1, 2, \dots$ are formal even variables and θ_i^s , $i = 1, \dots, n$, $s = 0, 1, 2, \dots$ are odd variables. An element in $C^\infty(U)$ is represented by a function of the coordinates u^i , $i = 1, \dots, n$ on the domain $U \subset \mathbb{R}^n$. We define the *standard gradation* on $\hat{\mathcal{A}}$ by assigning the degrees

$$\deg u^{i,s} = \deg \theta_i^s = s, \quad s = 1, 2, \dots$$

and degree zero to both $\theta_i = \theta_i^0$ and the elements in $C^\infty(U)$. The standard degree d homogeneous component of $\hat{\mathcal{A}}$ is denoted $\hat{\mathcal{A}}_d$. Notice that $\hat{\mathcal{A}}_d$ coincides with the standard degree d homogeneous component of the polynomial algebra $C^\infty(U)[u^{i,1}, \dots, u^{i,d}; \theta_i^0, \dots, \theta_i^d]$. The *super gradation* is defined by assigning degree one to θ_i^s for $s \geq 0$ and degree zero to the remaining generators of $\hat{\mathcal{A}}$. The super degree p homogeneous component is denoted $\hat{\mathcal{A}}^p$. We also denote

$$\hat{\mathcal{A}}_d^p = \hat{\mathcal{A}}_d \cap \hat{\mathcal{A}}^p.$$

The standard derivation on $\hat{\mathcal{A}}$,

$$\partial = \sum_{s \geq 0} \left(u^{i,s+1} \frac{\partial}{\partial u^{i,s}} + \theta_i^{s+1} \frac{\partial}{\partial \theta_i^s} \right),$$

is compatible with the standard and super gradations, in particular it increases the standard degree by one and leaves invariant the super degree. Thanks to the homogeneity of ∂ , the space $\hat{\mathcal{F}} := \frac{\hat{\mathcal{A}}}{\partial \hat{\mathcal{A}}}$ still possesses two gradations, which we keep denoting with indices p and d . The elements of $\hat{\mathcal{F}}^p$

are called *local p-vectors* and the projection map is denoted by an integral

$$\int : \hat{\mathcal{A}} \rightarrow \hat{\mathcal{F}}.$$

The space $\hat{\mathcal{F}}$ can be endowed with the Schouten-Nijenhuis bracket

$$[,] : \hat{\mathcal{F}}^p \times \hat{\mathcal{F}}^q \rightarrow \hat{\mathcal{F}}^{p+q-1},$$

which satisfies the usual graded skew-symmetry and graded Jacobi identities, see [12, 11] for more details.

A Poisson bivector P is an element of $\hat{\mathcal{F}}^2$ that satisfies $[P, P] = 0$. If P is a Poisson bivector, its adjoint action $d_P = [P, \cdot]$ on $\hat{\mathcal{F}}$ by the graded Jacobi identity squares to zero, hence defines a differential complex $(\hat{\mathcal{F}}, d_P)$. Given a Poisson bivector P , the super derivation D_P on $\hat{\mathcal{A}}$ is defined by

$$D_P = \sum_{s \geq 0} \left(\partial^s \left(\frac{\delta P}{\delta \theta_i} \right) \frac{\partial}{\partial u^{i,s}} + \partial^s \left(\frac{\delta P}{\delta u^i} \right) \frac{\partial}{\partial \theta_i^s} \right),$$

where the variational derivatives on $\hat{\mathcal{A}}$ w.r.t. u^i and θ_i are defined as follows

$$\frac{\delta}{\delta u^i} = \sum_{s=0}^{\infty} (-\partial)^s \frac{\partial}{\partial u^{i,s}}, \quad \frac{\delta}{\delta \theta_i} = \sum_{s=0}^{\infty} (-\partial)^s \frac{\partial}{\partial \theta_i^s}.$$

The super derivation D_P squares to zero, and is such that the integral defines a map of differential complexes

$$\int : (\hat{\mathcal{A}}, D_P) \rightarrow (\hat{\mathcal{F}}, d_P).$$

As pointed out in [12] this allows us to work with the complex $(\hat{\mathcal{A}}, D_P)$ rather than with the more complicated $(\hat{\mathcal{F}}, d_P)$.

A Poisson pencil is given by two Poisson bivectors P_1, P_2 which are compatible, i.e. $[P_1, P_2] = 0$. For each λ , then, $P_\lambda := P_2 - \lambda P_1$ is also a Poisson bivector. We denote by d_1 and d_2 the differentials on $\hat{\mathcal{F}}$ corresponding to P_1 and P_2 , respectively. Due to compatibility, $d_\lambda := d_2 - \lambda d_1$ squares to zero. We denote by D_1 and D_2 the super derivations on $\hat{\mathcal{A}}$ associated to P_1 and P_2 , respectively. Their compatibility in this case implies that $D_\lambda := D_2 - \lambda D_1$ also squares to zero. In summary we can define two differential complexes associated to a Poisson pencil

$$(\hat{\mathcal{A}}[\lambda], D_\lambda), \quad (\hat{\mathcal{F}}[\lambda], d_\lambda).$$

Remark 3. The Poisson brackets $\{, \}_{1,2}$ introduced in (2) are elements of the space Λ_{loc}^2 of local bivectors written in δ -formalism, see [7]. There is a one to one correspondence between the space of local p -vectors Λ_{loc}^p , written in δ -formalism and the space $\hat{\mathcal{F}}^p$. We will not recall it here in general but rather refer the reader to [12]. For the case of a bivector, written as

$$\{u^i(x), u^j(y)\} = \sum_{s \geq 0} B_s^{ij} \delta^{(s)}(x - y),$$

with $B_s^{ji} \in \mathcal{A}$, the corresponding element in $\hat{\mathcal{F}}^2$ is

$$P = \frac{1}{2} \int \theta_i \sum_{s \geq 0} B_s^{ij} \theta_j^s.$$

2.2. The complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$. Let us fix a semisimple Poisson pencil of hydrodynamic type $\{\cdot, \cdot\}_\lambda^0 = \{\cdot, \cdot\}_2^0 - \lambda \{\cdot, \cdot\}_1^0$, and denote by u^1, \dots, u^n the associated canonical coordinates on $U \subset \mathbb{R}^n$, see §1.2. The compatible Poisson brackets $\{\cdot, \cdot\}_{1,2}^0$ are represented in $\hat{\mathcal{F}}_1^2$ by two bivectors

$$P_a = \frac{1}{2} \int \left(g_a^{ij} \theta_i^0 \theta_j^1 + \Gamma_{k,a}^{ij} u^{k,1} \theta_i \theta_j \right), \quad a = 1, 2.$$

In canonical coordinates the Christoffel symbol of $g_1^{ij} = f^i \delta_{ij}$ is

$$\Gamma_{k,1}^{ij} = \frac{1}{2} \left(\partial_k f^i \delta_{ij} + \frac{f^i}{f^j} \partial_i f^j \delta_{jk} - \frac{f^j}{f^i} \partial_j f^i \delta_{ik} \right)$$

and P_1 is given by

$$P_1 = \frac{1}{2} \int \left(f^i \theta_i \theta_i^1 + \frac{f^i}{f^j} \partial_i f^j u^{j,1} \theta_i \theta_j \right).$$

We denote by $D_1 = D(f^1, \dots, f^n)$ the super derivation on $\hat{\mathcal{A}}$ corresponding to P_1 . A straightforward computation gives us the following formula

$$\begin{aligned} D(f^1, \dots, f^n) &= \sum_{s \geq 0} \partial^s (f^i \theta_i^1) \frac{\partial}{\partial u^{i,s}} \\ &+ \frac{1}{2} \sum_{s \geq 0} \partial^s \left(\partial_j f^i u^{j,1} \theta_i^0 + f^i \frac{\partial_j f^j}{f^j} u^{j,1} \theta_j^0 - f^j \frac{\partial_j f^i}{f^i} u^{i,1} \theta_j^0 \right) \frac{\partial}{\partial u^{i,s}} \\ &+ \frac{1}{2} \sum_{s \geq 0} \partial^s \left(\partial_i f^j \theta_j^0 \theta_j^1 + f^j \frac{\partial_j f^i}{f^i} \theta_i^0 \theta_j^1 - f^j \frac{\partial_j f^i}{f^i} \theta_j^0 \theta_i^1 \right) \frac{\partial}{\partial \theta_i^s} \\ &+ \frac{1}{2} \sum_{s \geq 0} \partial^s \left(\frac{\partial}{\partial u^i} \left(\frac{f^k}{f^j} \partial_k f^j \right) u^{j,1} \theta_k \theta_j - \frac{\partial}{\partial u^j} \left(\frac{f^k}{f^i} \partial_k f^i \right) u^{j,1} \theta_k \theta_i \right) \frac{\partial}{\partial \theta_i^s}. \end{aligned} \quad (3)$$

Notice that D is an homogeneous operator of standard degree one, therefore it is well-defined on $\hat{\mathcal{A}}[\lambda]$, because each homogeneous component $\hat{\mathcal{A}}_d[\lambda]$ the infinite sums appearing in (3) have only a finite number of non-vanishing terms.

The super derivation corresponding to P_2 is then given by

$$D_2 := D(u^1 f^1, \dots, u^n f^n).$$

Our aim is to compute the cohomology of the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ with $D_\lambda = D_2 - \lambda D_1$, and D_1, D_2 given above.

2.3. The main theorem. In Section 3 we prove the following vanishing theorem for the cohomology of the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$.

Theorem 4. *The cohomology $H_d^p(\hat{\mathcal{A}}[\lambda], D_\lambda)$ vanishes for all bi-degrees (p, d) , unless*

$$d = 0, \dots, n, \quad p = d, \dots, d + n,$$

or

$$d = n + 1, n + 2, \quad p = d, \dots, d + n - 1.$$

Remark 5. For $n = 1$ the bi-degrees for which we cannot state vanishing according to Theorem 4 are

$$(p, d) = (0, 0), (1, 0), (1, 1), (2, 1), (2, 2), (3, 3).$$

In [5] (and in [4] for the KdV case) we compute by a different method the cohomology $H_d^p(\hat{\mathcal{A}}[\lambda], D_\lambda)$ for all bi-degrees, proving in particular that it vanishes also for

$$(p, d) = (1, 0), (1, 1), (2, 2).$$

This shows that the vanishing theorem above can be strengthened. Our result is enough, however, to prove the absence of obstructions to deformations of bihamiltonian structures, which is our main aim.

Remark 6. In the proof of Theorem 4 we will distinguish two sets of indexes for which we do not prove vanishing:

$$d = 0, \dots, n, \quad p = d, \dots, d + n \quad (\text{Case 1}),$$

and

$$d = 2, \dots, n + 2, \quad p = d, \dots, d + n - 1 \quad (\text{Case 2}),$$

which clearly overlap for $n \geq 2$. We distinguish the two cases since they have different sources in the complex.

2.4. Vanishing of bihamiltonian cohomology. By the following lemma of Liu and Zhang [12], the bihamiltonian cohomology of $\hat{\mathcal{F}}$ is isomorphic to the cohomology of the complex¹ $(\hat{\mathcal{F}}[\lambda], d_\lambda)$ in almost all degrees (p, d) . Let $(C, \partial_1, \partial_2)$ be either the double complex $(\hat{\mathcal{A}}, D_1, D_2)$ or $(\hat{\mathcal{F}}, d_1, d_2)$. The bihamiltonian cohomology of the double complex $(C, \partial_1, \partial_2)$ is defined by

$$BH(C, \partial_1, \partial_2) = \frac{\text{Ker } \partial_1 \cap \text{Ker } \partial_2}{\text{Im } \partial_1 \partial_2}.$$

Lemma 7. *The natural embedding of C in $C[\lambda]$ induces an isomorphism*

$$BH_d^p(C, \partial_1, \partial_2) \cong H_d^p(C[\lambda], \partial_\lambda)$$

for $p \geq 0, d \geq 2$.

As pointed out in [12], the short exact sequence of complexes

$$0 \rightarrow (\hat{\mathcal{A}}[\lambda]/\mathbb{R}[\lambda], D_\lambda) \rightarrow (\hat{\mathcal{A}}[\lambda], D_\lambda) \rightarrow (\hat{\mathcal{F}}[\lambda], d_\lambda) \rightarrow 0$$

implies a long exact sequence in cohomology, which includes

$$\dots \rightarrow H_d^p(\hat{\mathcal{A}}[\lambda]) \rightarrow H_d^p(\hat{\mathcal{F}}[\lambda]) \rightarrow H_d^{p+1}(\hat{\mathcal{A}}[\lambda]) \rightarrow \dots$$

for $p, d \geq 0$. It is clear that if both $H_d^p(\hat{\mathcal{A}}[\lambda], D_\lambda)$ and $H_d^{p+1}(\hat{\mathcal{A}}[\lambda], D_\lambda)$ vanish, then $H_d^p(\hat{\mathcal{F}}[\lambda], d_\lambda)$ vanishes too. Our vanishing result for $H_d^p(\hat{\mathcal{A}}[\lambda])$ translates to the following statement for the cohomology of the complex $(\hat{\mathcal{F}}[\lambda], d_\lambda)$.

Corollary 8. *The cohomology $H_d^p(\hat{\mathcal{F}}[\lambda], d_\lambda)$ vanishes for all bi-degrees (p, d) , unless*

$$d = 0, \dots, n, \quad p = d - 1, \dots, d + n,$$

or

$$d = n + 1, n + 2, \quad p = d - 1, \dots, d + n - 1.$$

¹A similar description in terms of a bicomplex was given in [3].

Using the isomorphism of Lemma 7 we obtain the vanishing of the bihamiltonian cohomology of $\hat{\mathcal{F}}$.

Corollary 9. *The bihamiltonian cohomology $BH_d^p(\hat{\mathcal{F}}, d_1, d_2)$ vanishes for all bi-degrees (p, d) with $d \geq 2$, unless*

$$d = 2, \dots, n, \quad p = d - 1, \dots, d + n,$$

or

$$d = n + 1, n + 2, \quad p = d - 1, \dots, d + n - 1.$$

Remark 10. Notice that in particular it follows that

$$BH_{\geq 4}^2(\hat{\mathcal{F}}, d_1, d_2) = 0, \quad BH_{\geq 5}^3(\hat{\mathcal{F}}, d_1, d_2) = 0.$$

The vanishing of the second cohomology for $d \geq 4$ has been already proved in [9, 6], together with the results

$$BH_2^2(\hat{\mathcal{F}}, d_1, d_2) = 0, \quad BH_3^2(\hat{\mathcal{F}}, d_1, d_2) \cong \bigoplus_{i=1}^n C^\infty(\mathbb{R}).$$

The vanishing of the third cohomology for $d \geq 5$ is new, and is the most relevant for the extension problem of deformation theory.

2.5. Bihamiltonian cohomology and deformations. The deformation problem can be formulated in $\hat{\mathcal{F}}$ as follows. Let $P_\lambda^0 = P_2^0 - \lambda P_1^0 \in \hat{\mathcal{F}}_1^2[\lambda]$ be a semisimple Poisson pencil of hydrodynamic type. A deformation of P_λ^0 is given by $P_\lambda = P_2 - \lambda P_1 \in \hat{\mathcal{F}}_{\geq 1}^2[\lambda]$ with $P_\lambda - P_\lambda^0 \in \hat{\mathcal{F}}_{\geq 2}^2$ and $[P_\lambda, P_\lambda] = 0$. An infinitesimal deformation of P_λ^0 is given by

$$P_\lambda^{\leq 2} = P_\lambda^0 + P_\lambda^1 + P_\lambda^2, \quad P_\lambda^{d-1} = P_2^{d-1} - \lambda P_1^{d-1} \in \hat{\mathcal{F}}_d^2[\lambda]$$

such that

$$[P_\lambda^{\leq 2}, P_\lambda^{\leq 2}] \in \hat{\mathcal{F}}_{\geq 5}^3[\lambda].$$

A deformation P_λ of P_λ^0 extends a infinitesimal deformation $P_\lambda^{\leq 2}$ if $P_\lambda - P_\lambda^{\leq 2} \in \hat{\mathcal{F}}_{\geq 4}^3[\lambda]$.

The extension problem can be stated as follows: *given an infinitesimal deformation $P_\lambda^{\leq 2}$ of P_λ^0 , there exists a deformation P_λ extending $P_\lambda^{\leq 2}$?*

As pointed out in [12] the fact that the second bihamiltonian cohomology groups $BH_d^2(\hat{\mathcal{F}}, d_1, d_2)$ vanish for $d \geq 4$ and $d = 2$ but not for $d = 3$, implies that the vanishing of $BH_{\geq 6}^3(\hat{\mathcal{F}}, d_1, d_2)$ guarantees that any infinitesimal deformation $P_\lambda^{\leq 2}$ can be extended to a full deformation P_λ .

This result, expressed in the δ -formulation of local bivectors, is Theorem 2.

To see that the vanishing of $BH_{\geq 6}^3(\hat{\mathcal{F}})$ implies that the deformations are unobstructed, consider that any infinitesimal deformation can be put in the form

$$P_1^{\leq 2} = P_1^0, \quad P_2^{\leq 2} = P_2^0 + P_2^2$$

by an appropriate Miura transformation. Clearly P_2^2 is in the kernel of both d_1 and d_2 , hence identifies an element of $BH_3^2(\hat{\mathcal{F}})$. Let us look for a deformation of the form

$$P_1 = P_1^0, \quad P_2 = P_2^0 + P_2^2 + P_2^4 + P_2^6 + \dots \quad (4)$$

Let us first show that exist a term P_2^4 such that

$$d_1 P_2^4 = 0, \quad d_2 P_2^4 + \frac{1}{2}[P_2^2, P_2^2] = 0. \quad (5)$$

Clearly $[P_2^2, P_2^2] \in \hat{\mathcal{F}}_6^3$ is in $\text{Ker } d_1 \cap \text{Ker } d_2$, hence the vanishing of $BH_6^3(\hat{\mathcal{F}})$ implies that

$$d_1 d_2 Q_1 = \frac{1}{2}[P_2^2, P_2^2]$$

for some $Q_1 \in \hat{\mathcal{F}}_4^1$. Then $P_2^4 = d_1 Q_1$ gives a solution of (5).

At the next step of the deformation we want to find P_2^6 such that

$$d_1 P_2^6 = 0, \quad d_2 P_2^6 + [P_2^2, P_2^4] = 0. \quad (6)$$

As before $[P_2^2, P_2^4] \in \hat{\mathcal{F}}_8^3$ is in $\text{Ker } d_1 \cap \text{Ker } d_2$, hence the vanishing of $BH_8^3(\hat{\mathcal{F}})$ implies that there is an element $Q_2 \in \hat{\mathcal{F}}_6^1$ s.t. $d_1 d_2 Q_2 = [P_2^2, P_2^4]$. Then setting $P_2^6 = d_1 Q_2$ gives us the required solution of (6).

Since the vanishing of $BH_{\geq 6}^3(\hat{\mathcal{F}})$ ensures that this procedure can be continued indefinitely, as proved by induction in [12], the existence of a full deformation extending the infinitesimal deformation $P_\lambda^{\leq 2}$ indeed follows.

Notice that this in particular implies that any deformation can be put in the form (4), i.e., with the first Poisson tensor undeformed and the second one having only odd standard degree terms. This fact was also proved independently of the vanishing of the third bihamiltonian cohomology in [6].

3. FILTRATIONS AND SPECTRAL SEQUENCES

In this Section we give a proof of Theorem 4. It is a rather technical argument: basically, we introduce a sequence of filtrations and study the associated spectral sequences in order to show the vanishing of the cohomology in some degrees.

3.1. Strategy of the proof of Theorem 4. Before we start with the technical details, let us make some general remarks about the strategy of the proof. The theorem states that the cohomology of the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ vanishes in certain degrees (p, d) . We prove this vanishing by introducing several spectral sequences associated to certain filtrations.

Central to this derivation is the following simple principle: suppose we have a cochain complex (C, d) with a bounded decreasing filtration

$$\dots \subset F^{p+1}C \subset F^p C \subset \dots$$

The associated spectral sequence is bounded and converges to

$$E_1^{p,q} = H^{p+q}(F^p C / F^{p+1} C, d_0) \implies H^{p+q}(C, d),$$

where d_0 is the induced differential on the zeroth page, i.e. the associated graded complex. Suppose now that $H^p(E_k, d_k) = 0$ for some $k \geq 0$. Since all higher pages are iterated subquotients of E_k , we see that in this case $H^p(C, d) = 0$.

In the proof we will apply this principle inductively: we introduce a filtration on the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ which induces a spectral sequence. To show the vanishing of the cohomology of the first page E_1 , we introduce another filtration on this page, which induces a spectral sequence converging to the

second page E_2 of the previous spectral sequence. In this way, we apply in total a sequence of three filtrations. For the convenience of the reader, we list them below:

1. The first filtration is associated with the degree of monomials in $\hat{\mathcal{A}}[\lambda]$ in the variables $u^{i,s}$, $s \geq 1$, i.e. we assign degree 1 to each $u^{i,s}$, $s \geq 1$. The differential on the zeroth page of the associated spectral sequence is the part of D_λ that preserves this degree, whereas on the first page it is the part that decreases it by 1.
2. On the first page of the spectral sequence above, we consider the filtration given by the degree in θ_i^1 , for all $i = 1, \dots, n$, i.e., this time $\deg(\theta_i^1) = 1$, $i = 1, \dots, n$. On the zeroth page, the differential is given by the part of the differential in 1 (at the first page) that increases the number of θ_i^1 by 1.
3. The complex on the zeroth page in 2 splits as direct sum of complexes $\hat{\mathcal{C}}_i$, $i = 1, \dots, n$. To compute the cohomology of the subcomplex $\hat{\mathcal{C}}_i$, we filter by the degree of monomials in θ_i^1 , where this time i is fixed. On the zeroth page of the spectral sequence we finally find a complex of which we can prove the vanishing of the cohomology in the relevant degrees.

Having obtained the vanishing of the cohomology in 3, we apply the principle stated above to argue that the first page of the spectral sequence in 2 vanishes in certain degree. The same argument gives the vanishing of the second page of the spectral sequence in 1, which in turn proves the vanishing of the cohomology of the original complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ in certain degrees, i.e. Theorem 4.

3.2. Grading and subcomplexes. Since θ_i^s are odd variables, we have a restriction on possible gradings p and d on the space $\hat{\mathcal{A}}$. Indeed, the minimal possible standard degree d of a monomial in θ_i^s of super degree $p = nq + r$, $r < n$ is the degree of $\theta_1^0 \dots \theta_n^0 \dots \theta_1^{q-1} \dots \theta_n^{q-1} \theta_{i_1}^q \dots \theta_{i_r}^q$ equal to $n(0 + \dots + (q-1)) + rq = nq(q-1)/2 + rq$. So, the finitely generated $C^\infty(U)$ -module $\hat{\mathcal{A}}_d^p$ is zero for

$$d < nq(q-1)/2 + rq. \quad (7)$$

Moreover, the operators D_1 and D_2 (and, correspondingly, d_1 and d_2) are of bi-degree (p, d) equal to $(1, 1)$. Therefore, the difference $p - d$ is preserved by both operators, and this means that the space $\hat{\mathcal{A}}$ can be seen as the completion of an infinite direct sum of subcomplexes indexed by difference $d - p = -n, -n+1, \dots$. The inequality (7) implies that each of these subcomplexes is finite, and consequently we can compute the cohomology of each of them separately. For this general reason all the filtrations and spectral sequences introduced below will be bounded, and consequently the spectral sequences will converge in a finite number steps.

3.3. The first filtration. Let us define a degree \deg_u on $\hat{\mathcal{A}}[\lambda]$ by assigning degree one to $u^{i,s}$ with $s \geq 1$ and degree zero to the remaining generators.

The differential D_λ splits in homogeneous components Δ_k with respect to the degree \deg_u , i.e.,

$$D_\lambda = \Delta_{-1} + \Delta_0 + \dots,$$

where $\deg_u \Delta_k = k$.

One can easily check from (3) that the only term that lowers the degree \deg_u is

$$\Delta_{-1} = \sum_{s \geq 1} (-\lambda + u^i) f^i \theta_i^{s+1} \frac{\partial}{\partial u^{i,s}}.$$

The terms in (3) that preserve the degree \deg_u are:

$$\begin{aligned} \Delta_0 = & (-\lambda + u^i) f^i \theta_i^1 \frac{\partial}{\partial u^i} \\ & + \sum_{\substack{s=a+b \\ s,a \geq 1; b \geq 0}} (-\lambda + u^i) \binom{s}{b} \partial_j f^i u^{j,a} \theta_i^{1+b} \frac{\partial}{\partial u^{i,s}} + \sum_{\substack{s=a+b \\ s,a \geq 1; b \geq 0}} \binom{s}{b} f^i u^{i,a} \theta_i^{1+b} \frac{\partial}{\partial u^{i,s}} \\ & + \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} (-\lambda + u^i) \binom{s}{b} \partial_j f^i u^{j,1+a} \theta_i^b \frac{\partial}{\partial u^{i,s}} + \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} \binom{s}{b} f^i u^{i,1+a} \theta_i^b \frac{\partial}{\partial u^{i,s}} \\ & + \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} (-\lambda + u^i) \binom{s}{b} f^i \frac{\partial_j f^j}{f^j} u^{j,1+a} \theta_j^b \frac{\partial}{\partial u^{i,s}} + \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} \binom{s}{b} f^i u^{i,1+a} \theta_i^b \frac{\partial}{\partial u^{i,s}} \\ & - \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} (-\lambda + u^j) \binom{s}{b} f^j \frac{\partial_j f^i}{f^i} u^{i,1+a} \theta_j^b \frac{\partial}{\partial u^{i,s}} - \frac{1}{2} \sum_{\substack{s=a+b \\ s \geq 1; a, b \geq 0}} \binom{s}{b} f^i u^{i,1+a} \theta_i^b \frac{\partial}{\partial u^{i,s}} \\ & + \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} (-\lambda + u^j) \binom{s}{b} \partial_i f^j \theta_j^a \theta_j^{1+b} \frac{\partial}{\partial \theta_i^s} + \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} \binom{s}{b} f^i \theta_i^a \theta_i^{1+b} \frac{\partial}{\partial \theta_i^s} \\ & + \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} (-\lambda + u^j) \binom{s}{b} f^j \frac{\partial_j f^i}{f^i} \theta_i^a \theta_j^{1+b} \frac{\partial}{\partial \theta_i^s} + \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} \binom{s}{b} f^i \theta_i^a \theta_i^{1+b} \frac{\partial}{\partial \theta_i^s} \\ & - \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} (-\lambda + u^j) \binom{s}{b} f^j \frac{\partial_j f^i}{f^i} \theta_j^a \theta_i^{1+b} \frac{\partial}{\partial \theta_i^s} - \frac{1}{2} \sum_{\substack{s=a+b \\ s,a,b \geq 0}} \binom{s}{b} f^i \theta_i^a \theta_i^{1+b} \frac{\partial}{\partial \theta_i^s}. \end{aligned}$$

Suppose we introduce a filtration of $\hat{\mathcal{A}}[\lambda]$ related to the degree \deg_u . The usual decreasing filtration associated with \deg_u is defined as follows: let $\tilde{F}^r \hat{\mathcal{A}}[\lambda]$ be the subspace of $\hat{\mathcal{A}}[\lambda]$ of elements with homogenous components of \deg_u greater or equal to r . This filtration however is not preserved by D_λ , because of the presence of the term of negative degree Δ_{-1} .

Let us instead consider the decreasing filtration $F \hat{\mathcal{A}}[\lambda]$ of $\hat{\mathcal{A}}[\lambda]$ associated with the degree $\deg_u + \deg_\theta$. Let $F^r \hat{\mathcal{A}}[\lambda]$ be given by the elements in $\hat{\mathcal{A}}[\lambda]$ with homogeneous components in $\deg_u + \deg_\theta$ of degree $\geq r$. We get

$$\dots \subset F^2 \hat{\mathcal{A}}[\lambda] \subset F^1 \hat{\mathcal{A}}[\lambda] \subset F^0 \hat{\mathcal{A}}[\lambda] = \hat{\mathcal{A}}[\lambda].$$

Since $\deg_\theta D_\lambda = 1$, the differential D_λ preserves this filtration. Notice that this filtration, when restricted to each subcomplex $\hat{\mathcal{A}}_d^p[\lambda]$ with fixed difference $d - p$, is bounded.

Let us now consider the spectral sequence associated with the filtration $F\hat{\mathcal{A}}[\lambda]$. Since such filtration comes from a grading, the zeroth page is given by

$$E_0 = \bigoplus_{p,q} E_0^{p,q} = \bigoplus_{p,q} F^p \hat{\mathcal{A}}^{p+q}[\lambda] / F^{p+1} \hat{\mathcal{A}}^{p+q}[\lambda] \cong \hat{\mathcal{A}}[\lambda]$$

and the induced differential by Δ_{-1} , i.e.,

$$(E_0, d_0) = (\hat{\mathcal{A}}[\lambda], \Delta_{-1}).$$

To obtain the first page of the spectral sequence we need therefore to compute the cohomology of the complex $(\hat{\mathcal{A}}[\lambda], \Delta_{-1})$.

We define

$$\hat{\mathcal{C}} := C^\infty(U)[[\theta_1^0, \dots, \theta_n^0, \theta_1^1, \dots, \theta_n^1]],$$

and

$$\hat{\mathcal{C}}_i := \hat{\mathcal{C}}[[\{u^{i,s}, \theta_i^{s+1}, s \geq 1\}]].$$

On $\hat{\mathcal{C}}_i$, we denote by \hat{d}_i the de Rham differential

$$\hat{d}_i = \sum_{s \geq 1} \theta_i^{s+1} \frac{\partial}{\partial u^{i,s}}.$$

Proposition 11. *The cohomology of Δ_{-1} is given by*

$$H(\hat{\mathcal{A}}[\lambda], \Delta_{-1}) \cong \hat{\mathcal{C}}[\lambda] \oplus \bigoplus_{i=1}^n \text{Im} \left(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i \right).$$

Before we start the proof of this proposition, as a preliminary step, we observe that the cohomology of the de Rham complex $(\hat{\mathcal{C}}_i, \hat{d}_i)$ is trivial in positive degree.

Lemma 12 (“Poincaré lemma”).

$$H(\hat{\mathcal{C}}_i, \hat{d}_i) = \hat{\mathcal{C}}.$$

Proof. A simple proof of this fact can be given in terms of an homotopy map, a procedure that we will use repeatedly in the following. For fixed $i = 1, \dots, n$ and $s \geq 1$, let

$$h_{i,s} = \frac{\partial}{\partial \theta_i^{s+1}} \int du^{i,s},$$

where the integration constant is set to zero. We have

$$h_{i,s} \hat{d}_i + \hat{d}_i h_{i,s} = 1 - \pi_{u^{i,s}} \pi_{\theta_i^{s+1}}$$

where π_p denotes the projection that sets the variable p to zero. Given a cocycle $g \in \hat{\mathcal{C}}_i$ representing a cohomology class $[g]$, the previous formula implies that the same cohomology class can be represented by the cycle $\pi_{u^{i,s}} \pi_{\theta_i^{s+1}} g$. Repeating this process, we can kill all variables $u^{i,s}, \theta_i^{s+1}$ with $s \geq 1$, hence a cohomology class can be always represented by an element in $\hat{\mathcal{C}}$. Since $\text{Im } \hat{d}_i$ always contains θ_i^{s+1} with $s \geq 1$, no further simplification is possible. \square

Proof of Proposition 11. To prove Proposition 11 we introduce two homotopy maps. Let σ_i be the map that acts on a rational function of λ by removing the polar part at $\lambda = u^i$. For a polynomial $p(\lambda)$ we have

$$\sigma_i \left(\frac{p(\lambda)}{\lambda - u^i} \right) = \frac{p(\lambda) - p(u^i)}{\lambda - u^i}.$$

Fix $i = 1, \dots, n$ and $s \geq 1$ and let

$$h_{i,s} = \sigma_i \frac{1}{u^i - \lambda} \frac{1}{f^i} \frac{\partial}{\partial \theta_i^{s+1}} \int du^{i,s}.$$

Clearly $h_{i,s}$ defines a map on $\hat{\mathcal{A}}[\lambda]$ which satisfies

$$h_{i,s} \Delta_{-1} + \Delta_{-1} h_{i,s} = 1 - p_{i,s}, \quad (8)$$

where

$$p_{i,s} := \pi_{u^{i,s}} \pi_{\theta_i^{s+1}} + \left(\sum_{\substack{t \geq 1 \\ j}} \frac{f^j}{f^i} \theta_j^{t+1} \frac{\partial}{\partial \theta_i^{s+1}} \frac{\partial}{\partial u^{j,t}} \int du^{i,s} \right) \pi_{\lambda - u^i}.$$

As before π_p denotes the projection that sets the variable p to zero, in particular $\pi_{\lambda - u^i}$ sets λ to u^i .

In the derivation of formula (8) is useful to notice the following obvious identities

$$\int du^{i,s} \frac{\partial}{\partial u^{i,s}} = 1 - \pi_{u^{i,s}}, \quad \frac{\partial}{\partial \theta_i^{s+1}} \theta_i^{s+1} = \pi_{\theta_i^{s+1}}.$$

The operator $p_{i,s}$ is homogeneous of standard degree zero, hence it acts separately on each $\hat{\mathcal{A}}_d[\lambda]$, where the infinite sum appearing in its definition becomes finite, hence it is well defined. Moreover for s large enough, it acts like the identity. We therefore introduce a well-defined operator p_I on $\hat{\mathcal{A}}[\lambda]$, which is given by the application of all the operators $p_{i,s}$ in a given order, i.e.,

$$p_I = \dots \circ (p_{n,2} \circ \dots \circ p_{1,2}) \circ (p_{n,1} \circ \dots \circ p_{1,1}).$$

It is easy to check that the operator p_I maps $\hat{\mathcal{A}}[\lambda]$ to $\hat{\mathcal{A}}^{nt} \oplus \hat{\mathcal{C}}[\lambda]$, where by $\hat{\mathcal{A}}^{nt}$ we denote the subspace of $\hat{\mathcal{A}}$ spanned by monomials with non-trivial dependence on the variables $u^{i,s}, \theta_i^{s+1}$ with $i = 1, \dots, n, s \geq 1$.

By formula (8) when applied to a Δ_{-1} -cocycle the operator p_I produces an equivalent cocycle $\tilde{g} + g$ with $\tilde{g} \in \hat{\mathcal{A}}^{nt}$ and $g \in \hat{\mathcal{C}}[\lambda]$. Notice that g is a cocycle by itself, and can no longer be simplified by quotienting by $\text{Im } \Delta_{-1}$.

Let us now introduce a second homotopy operator. Let us denote $\Delta_{-1} = d'' - \lambda d'$ and define, for $s, t \geq 1$ and $i \neq j$

$$h_{i,s;j,t} = \frac{1}{u^i - u^j} \frac{1}{f^i f^j} \frac{\partial}{\partial \theta_i^{s+1}} \frac{\partial}{\partial \theta_j^{t+1}} \int du^{i,s} \int du^{j,t}.$$

We have

$$[h_{i,s;j,t}, d'' d'] = 1 - p_{i,s;j,t} + (\dots) d' + (\dots) d'',$$

where we did not specify the last two terms since they vanish when applied on elements in $\text{Ker } d' \cap \text{Ker } d''$, and

$$p_{i,s;j,t} := \pi_{u^{i,s}} \pi_{\theta_i^{s+1}} + \pi_{u^{j,t}} \pi_{\theta_j^{t+1}} - \pi_{u^{i,s}} \pi_{\theta_i^{s+1}} \pi_{u^{j,t}} \pi_{\theta_j^{t+1}}.$$

Clearly $p_{i,s;j,t}$ is a well-defined operator on $\hat{\mathcal{A}}[\lambda]$, which acts like the identity for large s or t . As before we define an operator p_{II} on $\hat{\mathcal{A}}[\lambda]$ given by the application of the such operators in a given order. The operator p_{II} acts like the identity on $\hat{\mathcal{C}}[\lambda]$ and maps $\hat{\mathcal{A}}^{nt}$ to $\oplus_i \hat{\mathcal{C}}_i^{nt}$, where $\hat{\mathcal{C}}_i^{nt} = \hat{\mathcal{C}}_i \cap \hat{\mathcal{A}}^{nt}$, since it obviously removes all monomials that contain any quadratic term of the form $u^{i,s}u^{j,t}$, $u^{i,s}\theta_j^{t+1}$ or $\theta_i^{s+1}\theta_j^{t+1}$ for $i \neq j$, $s, t \geq 1$. We denote by $\hat{\mathcal{M}}$ the subspace of $\hat{\mathcal{A}}$ spanned by such monomials.

Let us then consider the cocycle $\tilde{g} \in \hat{\mathcal{A}}^{nt}$. Since \tilde{g} does not depend on λ , it is in the kernel of Δ_{-1} iff $d'\tilde{g} = 0$ and $d''\tilde{g} = 0$. Moreover, an element of the form $d''d'f$ for $f \in \hat{\mathcal{A}}$ is in the image of Δ_{-1} and does not depend on λ , since $\Delta_{-1}d'f = d''d'f$. By the homotopy formula above it follows that p_{II} sends the cocycle \tilde{g} to an equivalent cocycle $\sum_i \tilde{g}_i$ for $\tilde{g}_i \in \hat{\mathcal{C}}_i^{nt}$.

Moreover, since $\hat{d}_i(\hat{\mathcal{C}}_i^{nt}) \subseteq \hat{\mathcal{C}}_i^{nt}$, and $\Delta_{-1} = \sum_i (\lambda - u^i) f^i \hat{d}_i$, we have that $\tilde{g}_i \in \text{Ker } \hat{d}_i$, which in turn, because of the vanishing of the cohomology $H(\hat{\mathcal{C}}_i, \hat{d}_i)$, is equivalent to $\tilde{g}_i \in \text{Im } \hat{d}_i \subseteq \hat{\mathcal{C}}_i^{nt}$.

To complete the proof we have to show that we cannot further quotient by elements in $\text{Im } \Delta_{-1}$ without spoiling the form of $\sum_i \tilde{g}_i$. Let $h(\lambda) \in \hat{\mathcal{A}}[\lambda]$ such that $\Delta_{-1}h(\lambda) = \sum_i g_i$ with $g_i \in \hat{\mathcal{C}}_i^{nt}$. Recall that $\Delta_{-1} = \sum_i (\lambda - u^i) f^i \hat{d}_i$ and observe that \hat{d}_i sends to zero $\hat{\mathcal{C}}[\lambda]$ and $\hat{\mathcal{C}}_j^{nt}[\lambda]$ for $j \neq i$. Moreover $\hat{d}_i(\hat{\mathcal{M}}) \subseteq \hat{\mathcal{M}}$. Therefore $h(\lambda) = \sum_i h_i(\lambda)$ for $h_i(\lambda) \in \hat{\mathcal{C}}_i^{nt}[\lambda]$ such that $f_i(\lambda - u^i) \hat{d}_i h_i(\lambda) = g_i$. Since g_i does not depend on λ this clearly implies that it has to be zero. We can conclude that the we cannot further simplify the cocycle $\sum_i \tilde{g}_i$.

Proposition 11 is proved. \square

We now continue to determine the differential on the first page of the spectral sequence. Define the space

$$\hat{\mathcal{B}} := \hat{\mathcal{C}}[\lambda] \oplus \bigoplus_{i=1}^n \frac{\text{Im} \left(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i \right) [\lambda]}{(\lambda - u^i)}, \quad (9)$$

where, in general, by $\frac{A[\lambda]}{(\lambda - u^i)}$ we denote the quotient of the space of polynomials $A[\lambda]$ by the space of polynomials that vanish at $\lambda = u^i$.

The inclusion $i : \hat{\mathcal{B}} \hookrightarrow \hat{\mathcal{A}}[\lambda]$ is defined as the identity on the first component $\hat{\mathcal{C}}[\lambda]$, and, on $\hat{d}_i(\hat{\mathcal{C}}_i)[\lambda]/(\lambda - u^i)$, as the standard inclusion after the evaluation at $\lambda = u^i$. Proposition 11 says that this inclusion $i : (\hat{\mathcal{B}}, 0) \hookrightarrow (\hat{\mathcal{A}}[\lambda], \Delta_{-1})$ induces an isomorphism on cohomology. The differential on the first page of the spectral sequence is just the differential induced on this cohomology by the next degree term Δ_0 of D_λ . More explicitly, we use i to embed elements $b \in \hat{\mathcal{B}}$ in $\hat{\mathcal{A}}[\lambda]$ as cocycles for Δ_{-1} , and apply Δ_0 . Because $D_\lambda^2 = 0$, we have $\Delta_{-1}\Delta_0 + \Delta_0\Delta_{-1} = 0$, and the result $\Delta_0 i(b)$ is another cocycle for Δ_{-1} , however not in the image of i . Therefore, to project down to the image of i , we use the homotopies described in the proof of Proposition 11. Let us denote by $p := p_{II} \circ p_I$ the map on $\hat{\mathcal{A}}[\lambda]$ defined by the composition p_I of all the maps $p_{i,s}$ followed by the composition p_{II} of all the maps $p_{i,s;j,t}$, defined in the proof of Proposition 11. In particular the

map p associates with a Δ_{-1} cocycle in $\hat{\mathcal{A}}[\lambda]$ the representative in $\hat{\mathcal{B}}$ of the corresponding cohomology class. We obviously have $p \circ i = \text{id}$. Then we have:

Proposition 13. *The first page of the spectral sequence associated with the filtration $F\hat{\mathcal{A}}[\lambda]$ is given by the complex*

$$(E_1, d_1) = (\hat{\mathcal{B}}, \Delta'_0),$$

with $\Delta'_0 = p \circ \Delta_0 \circ i$.

From the proof of Proposition 11 we can derive some properties of the map p , which we collect in the following Corollary. Let us write the space $\hat{\mathcal{A}}[\lambda]$ as the direct sum of three subspaces, i.e.,

$$\hat{\mathcal{A}}[\lambda] = \hat{\mathcal{C}}[\lambda] \oplus \left(\oplus_i \hat{\mathcal{C}}_i^{nt}[\lambda] \right) \oplus \hat{\mathcal{M}}[\lambda],$$

where, as already mentioned in the proof of Proposition 11, $\hat{\mathcal{C}}_i^{nt}$ is the subspace of $\hat{\mathcal{C}}_i$ generated by all nontrivial monomials, i.e., monomials that contain at least one generator among $u^{i,s}, \theta_i^{s+1}$ for $s \geq 1$, and $\hat{\mathcal{M}}$ is the subspace of $\hat{\mathcal{A}}$ generated by all nontrivial mixed monomials, i.e., monomials containing at least a pair of generators with different indices i . We further decompose

$$\hat{\mathcal{C}}_i^{nt}[\lambda] = \hat{\mathcal{C}}_i^{nt} \oplus (\lambda - u^i) \hat{\mathcal{C}}_i^{nt}[\lambda].$$

Corollary 14. *The map p acts as the identity on $\hat{\mathcal{C}}[\lambda]$ and $\hat{\mathcal{C}}_i^{nt} \cap \text{Ker } \hat{d}_i$, and it sends to zero the spaces $(\lambda - u^i) \hat{\mathcal{C}}_i^{nt}[\lambda]$, $i = 1, \dots, n$, and $\hat{\mathcal{M}}[\lambda]$.*

Proof. The projection p on $\hat{\mathcal{A}}[\lambda]$ is defined as $p_{II} \circ p_I$, where p_I is given by the composition of the operators $p_{i,s}$ for $s \geq 1$ and p_{II} by the composition of the operators $p_{i,s;j,t}$ for $i \neq j$, $s, t \geq 1$.

It is quite easy to check that $p_I = 1$ on $\hat{\mathcal{C}}[\lambda]$, since all $p_{i,s}$ act just like the identity.

On $\hat{\mathcal{C}}_i^{nt}[\lambda]$ the operator $p_{k,s}$ acts like the identity unless $i = k$. On $(\lambda - u^i) \hat{\mathcal{C}}_i^{nt}[\lambda]$ the operator $\pi_{\lambda - u^i}$ is equal to zero, so $p_{i,s} = \pi_{u^{i,s}} \pi_{\theta_i^{s+1}}$, therefore $p_I = 0$ on $(\lambda - u^i) \hat{\mathcal{C}}_i^{nt}[\lambda]$.

Notice that on $\hat{\mathcal{C}}_i^{nt}$ the operator $p_{i,s}$ becomes

$$p_{i,s} = 1 - \frac{\partial}{\partial \theta_i^{s+1}} \int du^{i,s} \hat{d}_i$$

while $p_{j,s} = 1$ for $j \neq i$, therefore on $\hat{\mathcal{C}}_i^{nt} \cap \text{Ker } \hat{d}_i$, the operator p_I acts like the identity. Moreover notice that $p_I(\hat{\mathcal{M}}[\lambda]) \subset \hat{\mathcal{M}}[\lambda]$.

Finally it is easy to see that p_{II} acts as the identity on $\hat{\mathcal{C}}[\lambda]$ and $\hat{\mathcal{C}}_i^{nt}[\lambda]$, and as the zero operator on $\hat{\mathcal{M}}[\lambda]$. The Corollary is proved. \square

3.4. The second filtration. We are now left with the problem of computing the second page E_2 of the spectral sequence associated with the filtration $F\hat{\mathcal{A}}[\lambda]$, which amounts, as explained in the previous section, to computing the cohomology of the operator Δ'_0 on the space $\hat{\mathcal{B}}$. This task is not trivial, so we introduce a filtration on $\hat{\mathcal{B}}$ and consider the associated spectral sequence.

Let us define a degree \deg_{θ^1} on $\hat{\mathcal{A}}$, and consequently on $\hat{\mathcal{B}}$, that simply counts the number of θ_i^1 , $i = 1, \dots, n$. The differential Δ_0 splits in three homogeneous components

$$\Delta_0 = \Delta_{0,1} + \Delta_{0,0} + \Delta_{0,-1}$$

where $\deg_{\theta^1} \Delta_{0,k} = k$. It is clear from their definition that the maps i and p preserve the degree \deg_{θ^1} , hence the homogeneous components of Δ'_0 are simply given by $\Delta'_{0,k} = p \circ \Delta_{0,k} \circ i$.

Let us now introduce on $\hat{\mathcal{B}}$ the decreasing filtration $F\hat{\mathcal{B}}$ associated with the degree $\deg_{\theta^1} - \deg_{\theta}$, i.e., let $F^r\hat{\mathcal{B}}$ be given by elements of $\hat{\mathcal{B}}$ with homogeneous components in $\deg_{\theta^1} - \deg_{\theta}$ of degree less or equal $-r$,

$$\dots \subset F^2\hat{\mathcal{B}} \subset F^1\hat{\mathcal{B}} \subset F^0\hat{\mathcal{B}} = \hat{\mathcal{B}}.$$

This filtration is preserved by Δ'_0 , hence this turns $(\hat{\mathcal{B}}, \Delta'_0)$ into a filtered complex to which we associate a spectral sequence (E'_k, d'_k) . The zeroth page is given by $\hat{\mathcal{B}}$ with induced differential given by $\Delta'_{0,1}$, i.e.,

$$(E'_0, d'_0) = (\hat{\mathcal{B}}, \Delta'_{0,1}).$$

Our aim is to compute the first page E'_1 , i.e., the cohomology of $\Delta'_{0,1}$ on $\hat{\mathcal{B}}$. Let us first compute the explicit expression of the differential.

Lemma 15. *The differential $\Delta'_{0,1}$ on $\hat{\mathcal{B}}$ is given by*

$$\Delta'_{0,1} = p \circ \hat{\Delta}_{0,1} \circ i$$

where

$$\begin{aligned} \hat{\Delta}_{0,1} = & (-\lambda + u^i) f^i \theta_i^1 \frac{\partial}{\partial u^i} \\ & + \sum_{s \geq 1} \frac{s+2}{2} f^i u^{i,s} \theta_i^1 \frac{\partial}{\partial u^{i,s}} \\ & - \frac{1}{2} \sum_{s \geq 1} (-\lambda + u^j) s f^j \frac{\partial_j f^i}{f^i} u^{i,s} \theta_j^1 \frac{\partial}{\partial u^{i,s}} \\ & - \frac{1}{2} (-\lambda + u^j) \partial_i f^j \theta_j^1 \theta_i^0 \frac{\partial}{\partial \theta_i^0} + \frac{1}{2} \sum_{s \geq 0} f^i (s-1) \theta_i^1 \theta_i^s \frac{\partial}{\partial \theta_i^s} \\ & - \frac{1}{2} \sum_{s \geq 0} (-\lambda + u^j) f^j \frac{\partial_j f^i}{f^i} (s+1) \theta_j^1 \theta_i^s \frac{\partial}{\partial \theta_i^s} \\ & + \frac{1}{2} (-\lambda + u^j) f^j \frac{\partial_j f^i}{f^i} \theta_i^1 \theta_j^0 \frac{\partial}{\partial \theta_i^0}. \end{aligned}$$

Proof. Let us first collect the terms in Δ_0 that increase the degree \deg_{θ^1} . We get:

$$\begin{aligned}
\Delta_{0,1} = & (-\lambda + u^i) f^i \theta_i^1 \frac{\partial}{\partial u^i} \\
& + \sum_{s \geq 1} (-\lambda + u^i) \partial_j f^i u^{j,s} \theta_i^1 \frac{\partial}{\partial u^{i,s}} + \sum_{s \geq 1} f^i u^{i,s} \theta_i^1 \frac{\partial}{\partial u^{i,s}} \\
& + \frac{1}{2} \sum_{s \geq 1} (-\lambda + u^i) s \partial_j f^i u^{j,s} \theta_i^1 \frac{\partial}{\partial u^{i,s}} + \frac{1}{2} \sum_{s \geq 1} s f^i u^{i,s} \theta_i^1 \frac{\partial}{\partial u^{i,s}} \\
& + \frac{1}{2} \sum_{s \geq 1} (-\lambda + u^i) s f^i \frac{\partial_j f^j}{f^j} u^{j,s} \theta_j^1 \frac{\partial}{\partial u^{i,s}} \\
& - \frac{1}{2} \sum_{s \geq 1} (-\lambda + u^j) s f^j \frac{\partial_j f^i}{f^i} u^{i,s} \theta_j^1 \frac{\partial}{\partial u^{i,s}} \\
& + \frac{1}{2} \sum_{s \geq 0} (-\lambda + u^j) \partial_i f^j (\theta_j^s \theta_j^1 + s \theta_j^1 \theta_j^s) \frac{\partial}{\partial \theta_i^s} + \frac{1}{2} \sum_{s \geq 0} f^i (\theta_i^s \theta_i^1 + s \theta_i^1 \theta_i^s) \frac{\partial}{\partial \theta_i^s} \\
& + \frac{1}{2} \sum_{\substack{s \geq 0 \\ s \neq 1}} (-\lambda + u^j) f^j \frac{\partial_j f^i}{f^i} (s+1) (\theta_i^s \theta_j^1 - \theta_j^s \theta_i^1) \frac{\partial}{\partial \theta_i^s} \\
& + (-\lambda + u^j) f^j \frac{\partial_j f^i}{f^i} \theta_i^1 \theta_j^1 \frac{\partial}{\partial \theta_i^1}.
\end{aligned}$$

Since Δ_{-1} has \deg_{θ^1} equal to zero, the equation $\Delta_0 \Delta_{-1} + \Delta_{-1} \Delta_0 = 0$ implies in particular that

$$\Delta_{0,1} \Delta_{-1} + \Delta_{-1} \Delta_{0,1} = 0.$$

Since the map i maps to the kernel of Δ_{-1} , it follows from the previous equation that $\Delta_{0,1} \circ i$ also maps to the kernel of Δ_{-1} .

Keeping in mind the properties of the map p outlined in Corollary 14, let us now determine which of the terms in the formula for $\Delta_{0,1}$ above, applied to an element in the image of i , are mapped to zero when composing with p .

The second, fourth and sixth terms are of the form

$$\sum_{s \geq 1} C_s^{ij} (\lambda - u^i) u^{j,s} \frac{\partial}{\partial u^{i,s}}$$

for $C_s^{ij} \in \hat{\mathcal{C}}$. When evaluated on the image of (9) through i , such operator clearly gives 0 on $\hat{\mathcal{C}}[\lambda]$. An element of $\hat{d}_i(\hat{\mathcal{C}}_i)$ is mapped, for $i \neq j$, to $\hat{\mathcal{M}}[\lambda]$, which in turn is mapped to zero by p . Finally, for $i = j$, such element is mapped again to an element in $\hat{\mathcal{C}}_i$, which however vanishes for $\lambda = u^i$, hence is mapped to zero by p . Hence these terms do not contribute to $\Delta'_{0,1}$.

The eighth term vanishes identically for $s = 1$ and for $s \geq 2$ either maps $\hat{\mathcal{C}}_i$ to $\hat{\mathcal{M}}[\lambda]$, in which case applying p gives zero, or maps $\hat{\mathcal{C}}_i$ to $\hat{\mathcal{C}}_j$ so that setting $\lambda = u_j$ yields zero. Therefore only the $s = 0$ term contributes.

In the tenth term, observe that the operator $(-\lambda + u^j) \theta_j^s$, $s \geq 2$ acting on $\hat{\mathcal{C}}_j$ gives zero when composing with p . Collecting all the remaining terms, we obtain the expression stated in the Lemma. \square

3.5. The third filtration. We have arrived at the problem of computing the cohomology of the complex $(\hat{\mathcal{B}}, \Delta'_{0,1})$. In this Section first we show that we can compute such cohomology on each of the $n + 1$ summands in (9) independently, and then we introduce our final filtration to estimate the possible non-vanishing (p, d) -degrees in the cohomology of $\Delta'_{0,1}$.

Let us start with the following observation:

Lemma 16. *The operator $\Delta'_{0,1}$ preserves the splitting (9) of the cohomology $\hat{\mathcal{B}}$ of Δ_{-1} in $n + 1$ summands, namely*

$$\Delta'_{0,1}(\hat{\mathcal{C}}[\lambda]) \subset \hat{\mathcal{C}}[\lambda],$$

$$\Delta'_{0,1}\left(\frac{\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)[\lambda]}{(u^i - \lambda)}\right) \subset \frac{\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)[\lambda]}{(u^i - \lambda)},$$

for $i = 1, \dots, n$.

Proof. Acting on $\hat{\mathcal{A}}[\lambda]$, one explicitly checks that each term of the operator $\hat{\Delta}_{0,1}$ as stated in Lemma 15 preserves the subspaces $\hat{\mathcal{C}}[\lambda]$ as well as $\hat{\mathcal{C}}_i^{nt}[\lambda]$. Since p is the identity on $\hat{\mathcal{C}}[\lambda]$, it is preserved by $\Delta'_{0,1}$, too.

As noticed before, we have that $\Delta_{0,1}\Delta_{-1} + \Delta_{-1}\Delta_{0,1} = 0$. Since $\Delta_{-1} = f^i(-\lambda + u^i)\hat{d}_i$ on $\hat{\mathcal{C}}_i^{nt}$, we get that $\Delta_{0,1}$ sends $\hat{\mathcal{C}}_i^{nt} \cap \text{Ker } \hat{d}_i = \hat{d}_i(\hat{\mathcal{C}}_i)$ to itself. Finally p acts like the identity on such space, which is therefore preserved by $\Delta'_{0,1}$. \square

This Lemma implies that we can compute the cohomology of $\Delta'_{0,1}$ on each of these $n + 1$ spaces separately. Let us start from $\hat{\mathcal{C}}[\lambda]$.

Lemma 17. *The cohomology of the complex $(\hat{\mathcal{C}}[\lambda], \Delta'_{0,1})$ vanishes if the bi-degrees (p, d) are not in the range*

$$d = 0, \dots, n, \quad p = d, \dots, d + n.$$

Proof. The possible (p, d) -degrees of the elements of $\hat{\mathcal{C}}[\lambda]$ are those of monomials $\theta_{i_1}^0 \dots \theta_{i_k}^0 \theta_{j_1}^1 \dots \theta_{j_\ell}^1$, $1 \leq i_1 < \dots < i_k \leq n$, $1 \leq j_1 < \dots < j_\ell \leq n$. So, for the standard gradation d we have $0 \leq d \leq n$, and, if we fix d , then for the super gradation p we have $d \leq p \leq d + n$. \square

Note that this Lemma gives Case 1 in the statement of Remark 6.

Now we want to estimate the cohomology of $\Delta'_{0,1}$ in each of the spaces $\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)[\lambda]/(u^i - \lambda)$, $i = 1, \dots, n$. For the rest of this Section the index i is fixed and refers to the particular space that we consider.

Obviously, the map $\pi_{\lambda - u^i}$ that sets λ to u^i defines an isomorphism between $\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)[\lambda]/(u^i - \lambda)$ and $\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)$. Let us denote by $\tilde{\Delta}'_{0,1}$ the operator induced by $\Delta'_{0,1}$ on $\hat{d}_i(\hat{\mathcal{C}}_i)$ by such isomorphism and let us represent it in the following way:

$$\tilde{\Delta}'_{0,1} = \sum_{k=1}^n \theta_k^1 \mathcal{D}_k,$$

where

$$\begin{aligned}
\mathcal{D}_k := & (u^k - u^i) f^k \frac{\partial}{\partial u^k} - \sum_{j=1}^n (u^k - u^i) f^k \frac{\partial_k f^j}{f^j} \theta_j^1 \frac{\partial}{\partial \theta_j^1} \\
& + \sum_{s \geq 1} \frac{s+2}{2} f^k u^{k,s} \frac{\partial}{\partial u^{k,s}} - \frac{1}{2} \sum_{s \geq 1} \sum_{j=1}^n (u^k - u^i) s f^k \frac{\partial_k f^j}{f^j} u^{j,s} \frac{\partial}{\partial u^{j,s}} \\
& + \frac{1}{2} \sum_{s \geq 2} f^k (s-1) \theta_k^s \frac{\partial}{\partial \theta_k^s} - \frac{1}{2} \sum_{s \geq 2} \sum_{j=1}^n (u^k - u^i) f^k \frac{\partial_k f^j}{f^j} (s+1) \theta_j^s \frac{\partial}{\partial \theta_j^s} \\
& - \frac{1}{2} \sum_{j=1}^n (u^k - u^i) \partial_j f^k \theta_k^0 \frac{\partial}{\partial \theta_j^0} - \frac{1}{2} f^k \theta_k^0 \frac{\partial}{\partial \theta_k^0} \\
& - \frac{1}{2} \sum_{j=1}^n (u^k - u^i) f^k \frac{\partial_k f^j}{f^j} \theta_j^0 \frac{\partial}{\partial \theta_j^0} + \frac{1}{2} \sum_{j=1}^n (u^j - u^i) f^j \frac{\partial_j f^k}{f^k} \theta_j^0 \frac{\partial}{\partial \theta_k^0}.
\end{aligned}$$

In particular

$$\begin{aligned}
\mathcal{D}_i = & \sum_{s \geq 1} \frac{s+2}{2} f^i u^{i,s} \frac{\partial}{\partial u^{i,s}} + \sum_{s \geq 2} \frac{s-1}{2} f^i \theta_i^s \frac{\partial}{\partial \theta_i^s} \\
& - \frac{1}{2} f^i \theta_i^0 \frac{\partial}{\partial \theta_i^0} + \frac{1}{2} \sum_{j=1}^n (u^j - u^i) f^j \frac{\partial_j f^i}{f^i} \theta_j^0 \frac{\partial}{\partial \theta_i^0}.
\end{aligned} \tag{10}$$

As a first step towards the computation of the cohomology of $\tilde{\Delta}'_{0,1}$ on the space $\hat{\mathcal{B}}_i := \hat{d}_i(\hat{\mathcal{C}}_i)$, we introduce the decreasing filtration $F\hat{\mathcal{B}}_i$ associated with the degree $\deg_{\theta_i^1} - \deg_{\theta}$, in the same way as we did for the filtration $F\hat{\mathcal{B}}$ before. In this case $\deg_{\theta_i^1}$ is the degree that counts the number of θ_i^1 for *fixed* i . Denote by (E''_k, d''_k) the associated spectral sequence. Since $\deg_{\theta_i^1} \mathcal{D}_k = 0$, the zeroth page is given by $\hat{\mathcal{B}}_i$ with the differential induced by $\theta_i^1 \mathcal{D}_i$, i.e.,

$$(E''_0, d''_0) = (\hat{\mathcal{B}}_i, \theta_i^1 \mathcal{D}_i).$$

We now proceed to find the first page of the spectral sequence by computing the cohomology of this complex. We will find restrictions on the possible (p, d) -degrees at which the cohomology can be non-trivial, which will be sufficient to complete the proof of our vanishing Theorem 4.

Proposition 18. *The cohomology of the differential $\theta_i^1 \mathcal{D}_i$ on the space $\hat{\mathcal{B}}_i = \hat{d}_i(\hat{\mathcal{C}}_i)$ vanishes,*

$$H_d^p(\hat{\mathcal{B}}_i, \theta_i^1 \mathcal{D}_i) = 0,$$

unless $d = 2, 3, \dots, n+2$, $p = d, d+1, \dots, d+n-1$.

Proof. In order to compute the cohomology of $\theta_i^1 \mathcal{D}_i$ on $\text{Im}(\hat{d}_i : \hat{\mathcal{C}}_i \rightarrow \hat{\mathcal{C}}_i)$, we represent this space as a direct sum of subcomplexes indexed by some auxiliary gradation. That is, we consider all possible non-constant polynomials in $u^{i, \geq 1}$ and $\theta_i^{\geq 2}$, and we represent this space as a direct sum

$$\mathbb{C}[u^{i, \geq 1}, \theta_i^{\geq 2}] = \bigoplus_{w \in \frac{1}{2}\mathbb{Z}} M_i^w,$$

where $M_i^w \subset \mathbb{C}[u^{i,\geq 1}, \theta_i^{\geq 2}]$ is the subspace of weighted homogeneous polynomials of the weight w , where the weight w is defined on generators as $w(u^{i,s}) = (s+2)/2$, $s = 1, 2, \dots$, and $w(\theta_i^s) = (s-1)/2$, $s = 2, 3, \dots$.

Lemma 19. *There is an isomorphism*

$$\hat{\mathcal{B}}_i \cong \bigoplus_{w \in \frac{1}{2}\mathbb{Z}} \hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w),$$

where each of the summands is preserved by the differential $\theta_i^1 \mathcal{D}_i$. Therefore the cochain complex $(\hat{\mathcal{B}}_i, \theta_i^1 \mathcal{D}_i)$ decomposes into a direct sum of subcomplexes indexed by all possible $w \in \frac{1}{2}\mathbb{Z}$.

Proof. A short computation shows that

$$[\mathcal{D}_i, \hat{d}_i] = -f^i \hat{d}_i.$$

Consider an element $\mathbf{m} \in M_i^w$. It follows from the identity above that

$$\begin{aligned} \theta_i^1 \mathcal{D}_i(\hat{\mathcal{C}} \hat{d}_i(\mathbf{m})) &\subset (\theta_i^1 \mathcal{D}_i(\hat{\mathcal{C}})) \cdot \hat{d}_i(\mathbf{m}) + \hat{\mathcal{C}} \cdot \theta_i^1 \mathcal{D}_i(\hat{d}_i(\mathbf{m})) \\ &= (\theta_i^1 \mathcal{D}_i(\hat{\mathcal{C}})) \cdot \hat{d}_i(\mathbf{m}) + \hat{\mathcal{C}} \cdot \theta_i^1 \hat{d}_i(\mathcal{D}_i - f^i)(\mathbf{m}). \end{aligned}$$

We see from equation (10) that $\theta_i^1 \mathcal{D}_i(\hat{\mathcal{C}}) \subset \hat{\mathcal{C}}$ and that $(\mathcal{D}_i - f^i)$ acts on \mathbf{m} by multiplication by a scalar and by f^i . This shows that $\theta_i^1 \mathcal{D}_i$ preserves the subspace $\hat{\mathcal{C}} \cdot \hat{d}_i(\mathbf{m})$, and, therefore, the space $\hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w)$ for any $w \in \frac{1}{2}\mathbb{Z}$. \square

Because of this Lemma, we can consider an infinite direct sum of complexes, each of which is a finite dimensional module over $\hat{\mathcal{C}}$. Note that $\hat{d}_i(M_i^w)$ is equal to 0 for $w < 3/2$, so we assume that $w \geq 3/2$ in the rest of the proof.

Let us discuss the action of $\theta_i^1 \mathcal{D}_i$. Observe that this operator is linear over the ring of functions in u^1, \dots, u^n and θ_j^1 , $j \neq i$. So, we omit the coefficients from this ring in the computations below, assuming that there can be an arbitrary coefficient that would be preserved.

Note that the eigenvalue of the operator

$$\sum_{s \geq 1} \frac{s+2}{2} u^{i,s} \frac{\partial}{\partial u^{i,s}} + \sum_{s \geq 2} \frac{s-1}{2} \theta_i^s \frac{\partial}{\partial \theta_i^s}$$

on $\hat{d}_i(M_i^w)$ is equal to $w-1$. Then the eigenvalue of \mathcal{D}_i on $\hat{d}_i(M_i^w)$ is $f^i(w-1)$. Observe that $w-1$ is always a positive half-integer, and the minimal value of $w-1$ is equal to $1/2$ for $w = 3/2$ and in this case $\hat{d}_i(M_i^{3/2}) = \langle \theta_i^2 \rangle$.

Consider monomials $\theta_{j_1}^0 \cdots \theta_{j_\ell}^0$ such that $1 \leq j_1 < \dots < j_\ell \leq n$, and $j_k \neq i$ for all $k = 1, \dots, \ell$. Let $\mathbf{m} \in M_i^w$. We have that

$$\theta_i^1 \mathcal{D}_i: \theta_{j_1}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m}) \mapsto f^i(w-1) \theta_{j_1}^1 \theta_{j_\ell}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m}).$$

So, since $w-1 \neq 0$, we see that the subspace of $\hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w)$ spanned by the elements $\theta_{j_1}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m})$ and $\theta_i^1 \theta_{j_1}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m})$ forms an acyclic subcomplex of $\hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w)$.

Now we consider monomials $\theta_i^0 \theta_{j_1}^0 \cdots \theta_{j_\ell}^0$ such that $1 \leq j_1 < \dots < j_\ell \leq n$, and $j_k \neq i$ for all $k = 1, \dots, \ell$. Let $\mathbf{m} \in M_i^w$. Modulo the acyclic subcomplex

that we introduced in the previous paragraph, we have that

$$\theta_i^1 \mathcal{D}_i : \theta_i^0 \theta_{j_1}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m}) \mapsto f^i \left(w - \frac{3}{2} \right) \theta_i^1 \theta_i^0 \theta_{j_1}^0 \cdots \theta_{j_\ell}^0 \hat{d}_i(\mathbf{m}).$$

Note that $w - 3/2$ is equal to zero only if $w = 3/2$, and, therefore, $\hat{d}_i(\mathbf{m}) \neq \theta_i^2$. Thus, if $w > 3/2$, the quotient of $\hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w)$ modulo an acyclic subcomplex is an acyclic subcomplex, and so $\hat{\mathcal{C}} \cdot \hat{d}_i(M_i^w)$ is acyclic.

The only possible case when we can have non-trivial cohomology is the case of $w = 3/2$, that is, the case of the complex $\hat{\mathcal{C}} \cdot \theta_i^2$. In this case, after taking the quotient modulo the acyclic subcomplex, the cohomology of $\theta_i^1 \mathcal{D}_i$ is represented by a product of $\theta_i^0 \theta_i^2$ by an arbitrary function in u^1, \dots, u^n , $\theta_1^0, \dots, \theta_n^0$ (θ_i^0 is omitted), and $\theta_1^1, \dots, \theta_n^1$. This means that we have non-trivial cohomology only for gradation $d = 2, 3, \dots, 2 + n$, and once we fixed d , the possible values of gradation p are $d, d + 1, \dots, d + n - 1$. This proves the Proposition. \square

Proof of Theorem 4. Recall from Remark 6 that we have to prove the vanishing of the bihamiltonian cohomology, except for the two cases 1 and 2 specified in that remark. The computations in this subsection show that the cohomology of Δ'_{01} vanishes, unless $d = 0, 1, \dots, n$; $p = d, d + 1, \dots, d + n$ (Case 1, coming from the sub-complex $\hat{\mathcal{C}}[\lambda]$), or $d = 2, 3, \dots, n + 2$, $p = d, d + 1, \dots, d + n - 1$ (Case 2, coming from the sub-complex $\hat{d}_i(\hat{\mathcal{C}})$). Going back via the second to the first spectral sequence, we conclude the vanishing of the cohomology groups of the complex $(\hat{\mathcal{A}}[\lambda], D_\lambda)$ in the same (p, d) -degrees: this is exactly the statement of Theorem 4. \square
